Sildenafil citrate, a selective phosphodiesterase type 5 inhibitor, has been used to treat erectile dysfunction in men, but can impair the clearance of multiple drugs, including the antidepressants (ADs). In this study, a group of 30 healthy volunteers took sildenafil citrate (25mg) for 5 days before continuous dosing of nortriptyline or escitalopram. The effects of sildenafil were not evident when the concentration-time curves of the antidepressant were investigated. Significant increases in area under the concentration-time curve and maximum drug concentration of nortriptyline and escitalopram were observed after administration of sildenafil, suggesting significant pharmacokinetic interactions. Sildenafil did not influence the pharmacokinetics of these drugs in therapeutic doses. This suggests that sildenafil may not negatively affect the pharmacokinetics of ADs in the usual clinical settings. Nevertheless, close drug monitoring should be recommended in patients receiving combination therapy.Climbing, exploring and enjoying the great outdoors with little ones.
